

The Packing Station TPS

Tired of charge backs? Not being able to verify what was packed into a case? Try a foolproof way to make sure what gets ordered, gets shipped - The Packing Station.

The Packing Station, an optional module available with Byte's Customer Order Processing (COP) module, allows your shipping and distribution personnel to scan SKUs into individual cases for maximum real-time shipping accuracy. The Packing Station can initiate automatic creation of all shipping documents, invoice, and Advanced Ship Notice (ASN), and automatically updates finished goods inventory ensuring the highest level of inventory accuracy.

Benefits

- **Unit Accountability:** Automatically updates all shipping records with what has been packed and shipped for each contract, order, release, and shipment.
- **Guarantee Shipping Accuracy:** Avoid shipping errors, which result in costly charge backs, by scanning each item being packed.
- **Avoid Shipping Incorrect Items:** The system automatically rejects incorrect SKUs and over shipment of SKUs.
- **Avoid Over/Under Shipments:** System interfaces with weigh scales to verify actual case weights with standard weights.

Flexible Shipping Options

The Packing Station and COP make it easy to set up shipping procedures the way *you* want them to work. These are just some of the options you'll have for picking, packing & shipping:

- *Allocate orders to generate picking tickets. Scan the pick ticket to bring up the order on screen.*
- *Each Packing Station is equipped with a thermal printer for printing case labels. When the case is packed, the system automatically prints the correct custom case label.*
- *Each Packing Station can be equipped with a weigh scale. When a case is packed, the system automatically calculates the weight and compares it to a standard weight table...or weigh cases as a separate operation all together.*
- *Leave a partially packed case for later completion.*
- *Add a case to an existing shipment or create a new shipment.*
- *Set ship dates for each shipment as needed...even leave the ship date open.*

Powerful Automated Functions

The Packing Station provides numerous automated functions to help increase the efficiency of your shipping operations:

- **Automatic Weight calculation:** Weigh scale interface for automatic weight calculations...calibration settings are set with a push of a button.
- **Automatic Freight Charge Calculation:** Built-in freight shipping zone tables calculate freight charges instantly.
- **Automatic Creation of ASNs and Other Shipping Documents:** All shipping documents are created automatically, including bar code case labels, packing slips, bills of lading, invoices, and ASNs.
- **Automatic Inventory Updating:** Works along with Byte's Finished Goods Inventory (FIC) module...automatically updates finished goods inventory.
